

Lesson 3 (High Power)

Controlling Motors, Pumps, Deathrays*, and other high power devices

* No, not for reals...

A POSTERIORI Play · Experience · Learn

Current Limits

- Arduino UNO max current
 - 40 mA per I/O pin
 - 200 mA total
 - 5V pin can <u>supply</u> 500mA (but, cannot be controlled in program)

20mA

150mA

300mA

1.8A (each motor)

Slides available at: http://a9i.sg/westwood

Current Limits

- 20mA is only enough for...
 - Small LEDs
 - Small speakers
 - Sensors (...most requires very little current)

Slides available at: http://a9i.sg/westwood

Transistor

- Works like a switch
 - Can control higher current than an Arduino I/O pin
 - Arduino I/O pin can be used to turn on or off

A POSTERIORI Play · Experience · Learn

Slides available at: http://a9i.sg/westwood

Transistor

A POSTERIORI Play · Experience · Learn

Slides available at: http://a9i.sg/westwood

Transistor

- Many types of transistors...
 - BJT, Darlington, MOSFET, JFET, PNP, NPN, etc...

- Model we are using: 2N7000
 - N-channel, Enhancement-mode, MOSFET
 - Max voltage 60V
 - Max current 200mA

- N-Channel
 - Connect transistor between Load and Ground
- Enhancement-mode
 - Supply voltage to turn on
- MOSFET
 - Gate draws very little current (...treated as zero)

Slides available at: http://a9i.sg/westwood

Exercise 1 Connecting Pumps

A POSTERIORI Play · Experience · Learn

Pump

- Mini-Submersible Pump
 - Red wire (positive): Connect to 5V
 - Black wire (ground): Connect to Transistor
 - Can be submerged in water
 - Cannot be reversed
 - Centrifugal type pump

A POSTERIORI Play · Experience · Learn

Slides available at: http://a9i.sg/westwood

Transistor + Pump

POSTERIORI

Play · Experience · Learn

Slide 10

Transistor + Pump

- When pin 11 is low (0 V)
- Transistor acts like an opened switch

Slides available at: http://a9i.sg/westwood

Transistor + Pump

- When pin 11 is high (5 V)
- Transistor acts like an closed switch

Slides available at: http://a9i.sg/westwood

Exercise 2 Controlling Pumps

A POSTERIORI Play · Experience · Learn

- Like an LED, we can adjust the power of the pump using PWM.
- Unlike an LED, the pump may not turn at all if the PWM power is too low

What's the lowest power you can set and still have the pump turn?

Slides available at: http://a9i.sg/westwood

Minimum Power

- Unlike an LED, a pump motor has inductance. This means that it takes a while for the current to flow.
- The pump will also need to overcome friction to start turning.
- If the PWM power is too low, it's not enough to overcome friction.

Slide 15

Up / Down Power

Use 2 buttons as Up/Down power inputs – when Up is pressed, the power increases (pump pumps faster), and when Down is pressed the power decreases...

You can use the Serial Monitor and Serial Arduino class to see the power being used in the program.

Slides available at: http://a9i.sg/westwood

UpDown Buttons

```
const int upPin = 2; // the Up pushbutton pin
const int pumpPin = 11; // the pump pin
int power = 0; // variable for remembering & setting power level
void setup() {
 pinMode(pumpPin, OUTPUT);
 pinMode(upPin, INPUT);
 Serial.begin(9600); // Create a Serial
 Serial.println("Power Settings");
}
void loop() {
 int upState = digitalRead(upPin);
 if (upState == HIGH) {
  power += 10;
  Serial.println(power);
  delay(500); // button freeze, to avoid undesired behavior (test without!)
 analogWrite(pumpPin, power);
```

Challenges

Hand Sanitizer with Button

- Create a program and circuit that...
 - Has a button to initiate pump squirts
 - Creates a "Off Time" to prevent over-squirting...
 Can use an LED to indicate when the program is ready to squirt again...

Slide 19

Functions

Use Functions to Simplify Code:

- Reduce code repetition / redundancy
- Avoid long, hard-to-decipher programs everything put into one big Loop() function
- Create code bits that are easy to understand and follow
- Modularize the code for quick changes

Functions

Simplify code by using functions, like "void squirt(int power, int time)", which makes the pump turn on with a certain power and time to effect a squirt.

```
int pumpPin = 11; // Pump transistor connected to digital pin 11
void setup() {
 pinMode(pumpPin, OUTPUT);
void squirt(int power, int time) {
 // Turn on pump with indicated power, for indicated duration, and then shut it
 analogWrite(pumpPin, power);
 delay(time);
 analogWrite(pumpPin, 0);
}
void loop() {
 // Use a button to initiate squirts
 squirt(100, 500);
 delay(5000);
```

Slide 21

- Use transistors to control high power devices
- Motors require a minimum power to start
- Use Functions to...
 - Replace repeated code
 - Break down complicated programs into smaller parts
